# project information retrieval system

## Internet access to ordnance site documents

**Documents Available** PIRS documents provide information for over 650 sites across the United States. The types of documents that can be found on the web site are:

- Inventory Project Reports (INPR)
- Archive Search Reports (ASR)
- Engineering Evaluation/Cost Analysis (EE/CA) work plans and final reports
- Removal Action (RA) and Time Critical Removal Action (TCRA) work plans and final reports

**Document Search** To help the user sort through the vast wealth of information, the web site offers interactive maps and a search engine. Three interactive maps of the United States enable the user to select either the state, Corps district, or EPA region that a site lies within. The user then selects the site from a current alphabetical listing to access the specific information.

A second aid to the user is the PIRS search engine. The PIRS search engine has indexed every word on the web site, offering the capability to instantly search through thousands of pages of documentation that otherwise would be scattered across the United States in Corps of Engineers' office filing cabinets.

**Benefits** Use of PIRS decreases document access time, reduces redundant hard copy storage at multiple sites, improves customer service, reduces office space, and reduces printing and mailing costs. Before PIRS, the technical manager could wait up to two weeks for a copy through the mail. The PIRS web site not only saves the technical managers time and money, it also saves the Corps geographic district time and money by not having to process requests for copies of documents. The general public is also benefiting from the PIRS web site. Over 200 persons visit the PIRS web site every day. Of those, about 125 are non-military users. They often use the PIRS web site to assist in checking the history of a piece of real estate that used to be a military facility.
