

MORTAR SIMULATION DEVICE

General: The Mortar Simulation Device (MSD) is a government provided item. The MSD requires an emplacement that is protected by an earthen berm. This emplacement has two parts. A three-sided concrete emplacement similar to the Stationary Infantry Target Emplacement. This houses the electronic interfaces and where the connections are made to the control room. The second emplacement is a three sided railroad tie emplacement. This emplacement houses the MSD. See the Civil Details in the Appendix of this document.
